# PAT3-SET3

1. Write a PHP script which decodes the following JSON string.

Sample JSON code :

{"Title": "The Cuckoos Calling",

"Author": "Robert Galbraith",

"Detail": {

"Publisher": "Little Brown"

}}

Expected Output :

Title : The Cuckoos Calling

Author : Robert Galbraith

Publisher : Little Brown2.

2. Create a PHP script that accepts a password string. The password must:

• Be at least 8 characters long.

• Contain at least one uppercase letter .

• Contain at least one digit.

• Contain at least one special character (e.g., @, #, $, %).

If the password does not meet any of these conditions, throw a custom exception with a

message like "Password must contain at least one uppercase letter". Handle the exception and

display the error message.

3. Add a "Remember Me" option that saves the username in a cookie.
